3.3 Mobile Evacuation

With the additional mobile evacuation module, EVALARM offers an innovative solution for the handling of evacuations.

With this module, you have a real-time overview of the state of the evacuation, so you can take action at any time.

The evacuation may be initiated centrally via the cockpit or on the mobile app depending on the situation.

Once it has been triggered for one or more building sectors, all persons connected with the building section and the objectives of the alert process are informed of the evacuation.

You can also leave important information to all participants in the details as a message.

Overview plans and route maps are only displayed in the web cockpit but not in the app during a mobile evacuation alarm.

Details	炅 Evacuation List	?) Missed Persons		

In addition, all authorized users see a list of all evacuated users and employees.

All (non) evacuees are clearly listed here.

People can be reported as evacuated or missing via a right swipe or by clicking on a contact.

In addition, it is also possible to evacuate people via e.g. the NFC function quickly and without further actions.

Lastly, there is also an overview of all $\ensuremath{\mbox{missing persons.}}$

Thus, all authorized persons know at any time which users have not logged back.

At the same time a missing person PUSH message will be sent with a request to confirm the status of the missing person.

This ensures that the overview is maintained at all times and that you can take appropriate countermeasures in any situation.
