

4) Connecting of technical systems

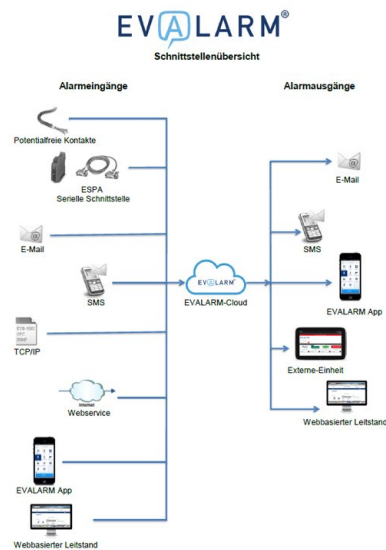

EVALARM Security therefore offers alarm monitoring at the highest level!

With EVALARM Security, you have the option of connecting technical systems and setting up alarm monitoring.

For example, you can easily switch on intrusion alarm systems, fire alarm systems, other hazard alarm systems, the building management system and other machines.

All faults, alarms etc. can be monitored in the WEB-based cockpit or control center and via the mobile apps.

The configuration can be done in a few minutes.

Connection of technical systems to EVALARM

EVALARM offers you the option of connecting all alarm devices, such as a fire alarm system, SOS buttons, building management systems or IT systems, to our system. EVALARM acts as a platform that receives signals and distributes the relevant information to the defined recipients as quickly as possible. As soon as an alarm device is activated in EVALARM, an alarm is triggered automatically. In addition to the rapid automated alerting of defined people, another advantage is that they combine all technical systems in one system and do not have to use their own app for each of their systems.

When connecting the systems, EVALARM offers several connection options. You can configure all SMS systems, e-mail systems and external systems via the ESPA interface or printer ports, for example.

Information on how to connect technical systems in EVALARM can be found in our general wiki at:

- [SMS-Systeme](#)
- [E-Mail-Systeme](#)
- [Externe Systeme \(ESPA, ASCII, ...\)](#)

If you have any further questions regarding the connection of technical systems, please contact us at any time at support@evalarm.de.
